

Updating package in openSUSE

Luboš Kocman
openSUSE Leap Release Manager

Meet openSUSE distributions

Tumbleweed

Leap

Slowroll

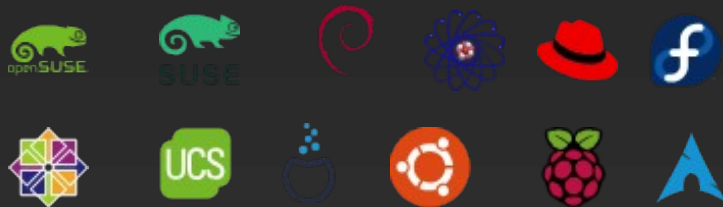

We have multiple Linux distributions that allow users to consume updates at user preferred pace. That affects you as a packager.

Meet Open Build Service

For building packages, images, flatpaks,
You can run your on prem instance.

**OBS supports more than just
openSUSE.**

Try it at build.opensuse.org

Factory Development Model

The heart of openSUSE development

“**Factory** is basically the main branch of openSUSE where everything is integrated before it reaches users.”

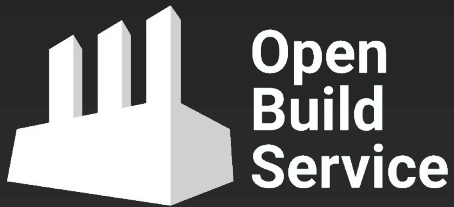

Theory

Packages get developed in specialized **development projects** and then are submitted to **Factory**.

Factory gets constant updates and serves as the foundation for openSUSE Tumbleweed

SLES and **Leap** follow a **Factory First policy**. All changes have to be submitted to Factory first.

Simple Example

Lubos is about to merge a fix in github.com/openSUSE/openSUSE-repos and wants to make fix available to all openSUSE distributions asap.

Lubos likes to have an easy life and wants to maintain a single version across all distros.

How would the workflow to update package in factory like?

We want to update devel project with latest sources and submit changes to Factory. This covers our rolling distros (Tumbleweed, Slowroll)

Once accepted, we want to submit change to all supported Leap releases (as of today it would be 15.6, 16.0, 16.1)

(From github's README.md)

**OBS is using cvs-style source code management.
Branch/Add/remove files/edit changes commit**

```
$ zypper install osc
$ osc bco Base:System/openSUSE-repos # your fork + build
$ cd */openSUSE-repos
$ osc service mr # source archive + changelog generation
$ osc addremove
$ osc commit # review changelog with osc vc -e
$ osc sr # submit request back to Base:System
```

\$ osc sr # submit request back to Base:System openSUSE-repos openSUSE:Factory

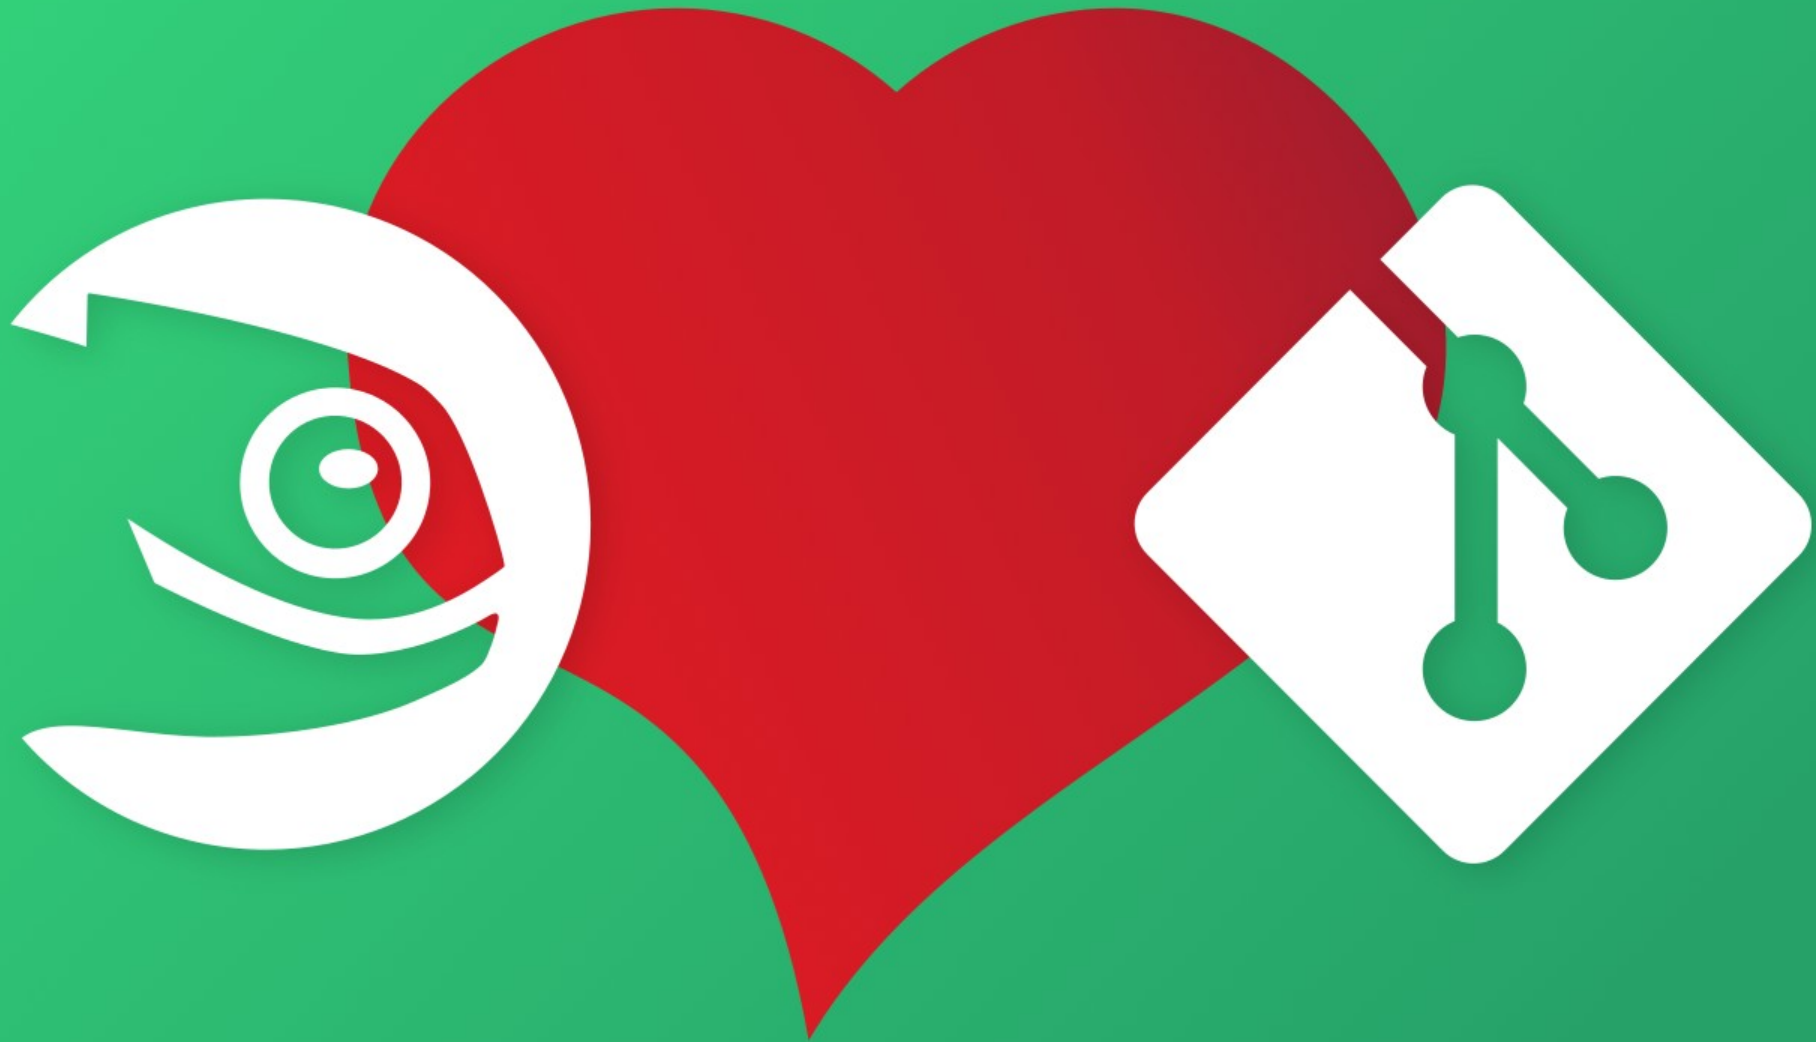

What was the osc service?

<https://openbuildservice.org/help/manuals/obs-user-guide/ha-obs-source-services>

Super useful for automatic source archive + changelog generation from github

We have services to help with bundling rubygems, npms and similar

Leap and SLES 16+ use
git(ea) unlike cvs-style obs

src.opensuse.org

The important part is **/pool** where we track
all distribution packages

[https://en.opensuse.org/
openSUSE:Git_Packaging_Workflow](https://en.opensuse.org/openSUSE:Git_Packaging_Workflow)

(From github's README.md)

Once Factory SR gets
reviewed/rejected/resubmitted/accepted

Fork factory branch of pool/openSUSE-repos
in <https://src.opensuse.org/pool/openSUSE-repos>

Make a PR against branches for supported Leap releases
and you're basically done! New osc comes with **git-obs for
cli!**

(I cheated a bit and prepped the „update“ branch in my fork ahead of time)

(From github's README.md)

Once SR reviewed/rejected/resubmitted/accepted in Factory

fork factory branch of pool/openSUSE-repos
in <https://src.opensuse.org/pool/openSUSE-repos>

Make a PR against branches for supported Leap releases
and you're basically done!

(I cheated a bit and prepped the „update“ branch in my fork ahead of time)

Troubleshooting our git workflow

Our adoption of git is not issueless
We've had an accident with rewriting Factory history in git.
This is the most common issue you will likely hit today.

If gitea is unable to show you a file diff then that's likely the case.

All common issues and tips are documented on wiki:
[https://en.opensuse.org/
openSUSE:Git_Packaging_Workflow#Git_History](https://en.opensuse.org/openSUSE:Git_Packaging_Workflow#Git_History)

(From github's README.md)

Once SR reviewed/rejected/resubmitted/accepted in Factory

fork factory branch of pool/openSUSE-repos
in <https://src.opensuse.org/pool/openSUSE-repos>

Make a PR against branches for supported Leap releases
and you're basically done!

(I cheated a bit and prepped the „update“ branch in my fork ahead of time)

Useful docs!

https://en.opensuse.org/openSUSE:Communication_channels

If you plan to package anything definitely join **Factory mailing list** and **irc/matrix channel**
